

DEMONSTRATION OF HAND CAST USING SURFACE BREAKER®

This hand cast demonstration shows the effectiveness of SURFACE BREAKER® in preventing bubble formation on the surface of a cast piece.

The photos below show a hand cast which has been taken from a silicone mould using standard techniques – bubbles can be seen covering large areas of the surface of the piece, producing a poor-quality finish.

By comparison, the photo below shows the same cast taken using **SURFACE BREAKER®** – this piece is smooth, highly detailed and completely bubble-free. After a quick clean-up, it's ready to go!

Standard casting process:

Cast taken using **SURFACE BREAKER®** (before clean up):
